MNQ Session Open Reversal v2: backtest stats

Source: Expected_Trades_2yr_Nov2024_Nov2026.csv · 5 Nov 2024 – 3 Nov 2026 · 5 MNQ · after commission · prepared 5 Nov 2026

1. The strategy, two years

	Eval (3/3 signals)	Funded (3/2 signals)
Trades	354	367
Win rate	47.7%	34.6%
Profit factor	1.52	1.61
Net (one account's worth of trades, never busting)	+$33,965	+$59,902
Average win / loss	$584 / −$350	$1,244 / −$408

The net figures are every trade added up as if one account traded nonstop. A real account can't do that: it would hit its max loss or take payouts along the way.

2. Hedging between eval and funded

9 times in two years an eval trade and a funded trade were open at the same moment on opposite sides. With the bot's hedge guard (needed for Topstep's rules) the later trade is skipped: 8 eval trades (−$948 net) and 1 funded trade (+$221 net). Only matters while eval and funded accounts trade at the same time.

3. Funded: which profit target to aim for (Topstep, payout 50% up to $2,000)

Aim for	Reached before busting	Payout to you (90%)	Worth per funded account
$2,000	60%	$900	$541
$3,000	58%	$1,350	$782
$4,000	**56%**	**$1,800**	**$1,007**
$5,000	55%	$1,800	$997

Reaching a target also needs 5 winning days of $150+. $4,000 is the sweet spot: aiming lower barely improves the odds, and the payout can't grow above it.

4. Topstep vs Lucid, 5 accounts bought together

	Topstep 50K	Lucid 50K
Eval price	$120 a month until passed	$180 once
Eval day cap / consistency	$1,600 / best day ≤ 50%	$1,200 / best day ≤ 40%
Eval pass rate	75%	64%
Time to pass (typical · 1 in 10)	37 · 68 days	48 · 86 days
Funded reaches $4,000 before busting	56%	56%
Payout to you, per account / 5 accounts	$1,800 / $9,000	$3,600 / $18,000
Eval fees, start to first payout (5 accounts): average	$1,707	$1,633
… typical · 1 in 10 · worst	$1,200 · $3,600 · $4,200	$900 · $3,600 · $4,500
Time to first payout (typical · 1 in 10 · worst)	13 · 26 · 34 weeks	15 · 29 · 34 weeks
Eval sets bought on average	1.64	1.81
Net on first payout day: average · worst	**$7,293 · $4,800**	**$16,367 · $13,500**

5. How these were worked out

- Every weekday in the two years is tried as a start day. A failed eval is rebought the next trading day; a funded account that busts sends you back to buying evals.
- Eval: pass at +$3,000 with the consistency rule; fail at a $2,000 trailing max loss from the highest end-of-day balance, locking at the start balance. Funded: $4,000 profit and 5 winning days of $150+, same max loss.
- The 5 accounts copy the same trades, so they pass, bust and pay out together: five accounts multiply the result, they don't spread the risk.
- Lucid's $1,200 day cap is applied by pulling in the winning trade that would pass it, and taking nothing more that day. Lucid's funded rules are assumed the same as Topstep's except for the full $4,000 withdrawal. Check Lucid's current rules.
- Not included: activation or data fees, platform/API fees, taxes.
- Trades are checked as they close, so dips inside a trade aren't seen. The settings were tuned on these same two years, so expect live results to be somewhat worse.
